Abstract

This paper reports on a two-tieved experiment designed to separately identify the selection and effort margins of pay-de-performance (P4P). At the recruitment stage, teacher labor marlets were readously assigned to a 'pay-de-perentific' or flowd-reap contract. Once recruitment we placed, as unexpected, investive-compatible, ashood-level re-randomization was performed, so that some teachers who applied for a line-leving construct ended up being paid by P4P, and vite versa. By the second year of the study, the within-year effort effect of P4P was 0.16 standard deviations of pupil learning, with the total effect doing to 0.20 standard deviations after allowing for selection.

Recruitment, Effort, and Retention Effects of Performance Contracts for Civil Servants: Experimental Evidence from Rwandan Primary Schools

This paper reports on a two-tiered experiment designed to separately identify the selection and effort margins of pay-for-performance (P4P). At the recruitment stage, teacher labor

markets were randomly assigned to a `pay-for-percentile' or fixed-wage contract. Once recruits were placed, an unexpected, incentive-compatible, school-level re-randomization was performed, so that some teachers who applied for a fixed-wage contract ended up being paid by P4P, and vice versa. By the second year of the study, the within-year effort effect of P4P was 0.16 standard deviations of pupil learning, with the total effect rising to 0.20 standard deviations after allowing for selection.
