Tackling psychosocial and capital constraints to alleviate poverty

 Check for updates

Many policies attempt to help extremely poor households build sustainable sources of income. Although economic interventions have predominated in historic development, psychosocial support has attracted substantial interest¹⁻³, particularly for its potential to cost-effectiveness. Recent evidence has shown that multi-faceted 'graduation' programmes can see cost in generating sustained changes^{4,5}. Here we show that a multi-faceted intervention can open pathways out of extreme poverty by relaxing capital and psychosocial constraints. We conducted a four-arm randomised evaluation among extremely poor female beneficiaries already enrolled in a national cash transfer/government programme in Niger. The three treatment arms included group savings promotion, coaching and entrepreneurship training, and then added either a lump-sum cash grant, psychosocial interventions, or both: the cash grant and psychosocial interventions. All three arms generated positive effects on economic outcomes and psychosocial wellbeing, but there were notable differences in the pathways and the timing of effects. Overall, the arms with psychosocial interventions were the most cost effective, highlighting the value of including well-designed psychosocial components in government-led multi-faceted interventions for the extreme poor.

We tested the following hypotheses of receiving capital and psychosocial constraints in alleviating extreme poverty by conducting a four arm randomized controlled trial (RCT) of a multi-faceted programme implemented by the Government of Niger on behalf of a poverty targeted cash transfer programme for women in Table 1. All study groups received monthly cash transfers. The three treatment arms added a core set of components: savings groups, a teaching and entrepreneurship training, a Capital arm added a lump sum cash grant. It is similar to the graduation programme. A psychosocial arm adds life skills training and a community mobilization or aspirations and social norms. The T4 arm adds both the cash grant and the psychosocial

We contribute to a growing literature on the economic impacts of professional associations. Whereas the previous empirical literature has focused on the effects of professional associations on the earnings of their members (e.g., *see* [Hansmann, 1980](#) and [Hansmann and Kohers, 1981](#)), and on the growth of the associations themselves (e.g., *see* [Hansmann, 1980](#) and [Hansmann and Kohers, 1981](#)), this study is the first to provide evidence on their longer-term impacts on poverty and their added value since economic integration in 1999. The professional literature studies have aimed both to build the skills of their constituents and to strengthen financial and moral support for their sector from their households and community. The psychosocial impact of this is based on the skills training for beneficiaries as well as income, higher trust in community participation – community-wide film screening and discussion targeting social norms and collective aspirations. The study finds that there are added social and psychosocial interventions, such as financial and social support, that are essential for the

Further, early graduation studies found little if impacts on women's empowerment¹¹, although stronger effects were documented when broader markers were considered¹². We analyse how the treatment

Tackling Psychosocial and Capital Constraints to Alleviate Poverty

Many policies attempt to help extremely poor households build sustainable sources of income. Although economic interventions have predominated historically^{1,2}, psychosocial support has attracted substantial interest^{3,4,5}, particularly for its potential cost-effectiveness. Recent evidence has shown that multi-faceted 'graduation' programmes can succeed in generating sustained changes^{6,7}. Here the researchers show that a multi-faceted intervention can open pathways out of extreme poverty by relaxing capital and psychosocial constraints. The researchers conducted a four-arm randomized evaluation among extremely poor female beneficiaries already enrolled in a national cash transfer government programme in Niger. The three treatment arms included group savings promotion, coaching and entrepreneurship training, and then added either a lump-sum cash grant, psychosocial interventions, or both the cash grant and psychosocial interventions. All three arms generated positive effects on economic outcomes and psychosocial well-being, but there were notable differences in the pathways and the timing of effects. Overall, the arms with psychosocial interventions were the most cost-effective, highlighting the value of including well-designed psychosocial components in government-led multi-faceted interventions for the extreme poor.
